#### SoLID Collaboration Meeting 2021/06

#### ANALYSIS AND SIMULATION FOR THE BEAM TEST OF TELESCOPE CHERENKOV PROTOTYPE

**CHAO PENG** Argonne National Laboratory

For SoLID Telescope Cherenkov Working Group

This work is supported by the U.S. Department of Energy, Office of Science, Office of Nuclear Physics, under Contract No. DE-AC02-06CH11357

### Outline

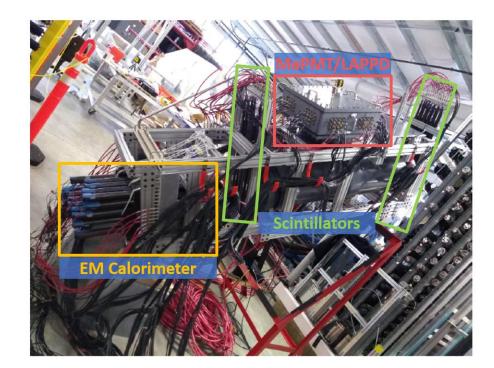

- Beam Test at Jefferson Lab
- Waveform Data Analysis
- Performance of LAPPD/MaPMT
- Summary and Plans

# **Telescope Cherenkov Detector Prototype**

- Detector package includes
  - Cherenkov tank (CO<sub>2</sub> at 0.3 psi)
  - 2 scintillator planes
  - 9 calorimeter blocks
  - 16 MaPMTs (quadrant and sum channels) or LAPPD (64 pixels)
- Readouts: JLab FADC250
  - Raw waveform data recorded
  - 64 samples in 256 ns

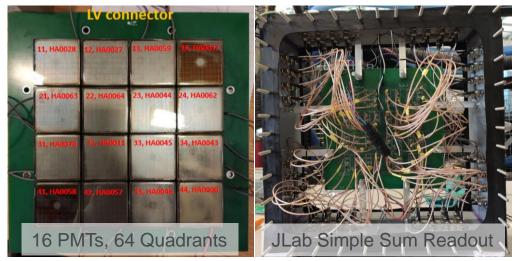

#### **Photosensors**

#### Hamamatsu MaPMT H12700-03

#### Refer to Bishnu's talk for MAROC readout

#### Incom LAPPD Gen-II

Argonne

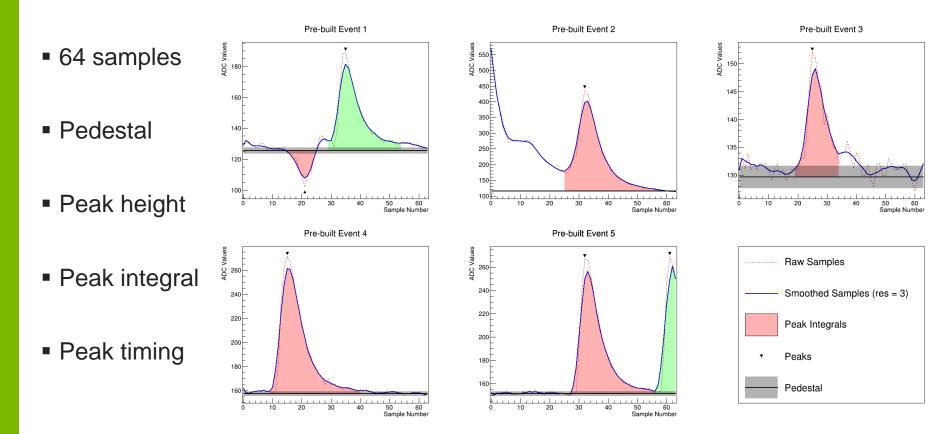

### **Beam Test at JLab**

- High rate beam test
  - Parasitic runs in June August, 2020
  - Small angle with 0.5 2  $\mu$ A beam
  - MaPMTs tested with total rates > 8 MHz per PMT (300 kHz per cm<sup>2</sup>)
- Low rate beam test
  - Parasitic runs in August September, 2020
  - Large angle, rates is one order of magnitude lower
- Bench test for LAPPD and MAROC readouts
  - Analysis is ongoing

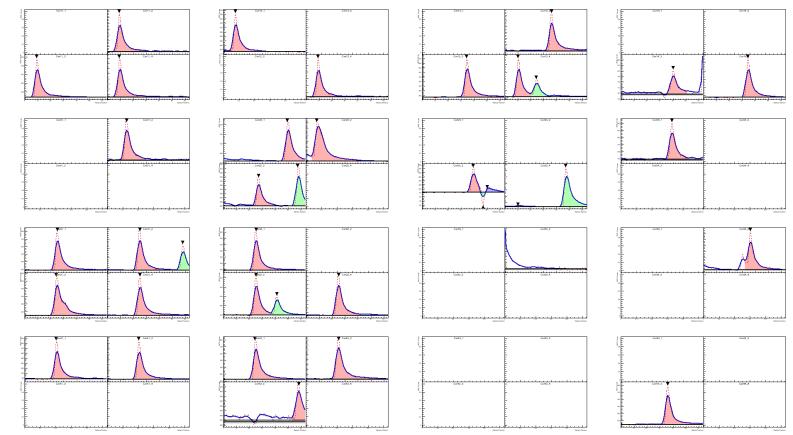

# **Waveform Data Analysis**

### **Waveform Data Event Samples**

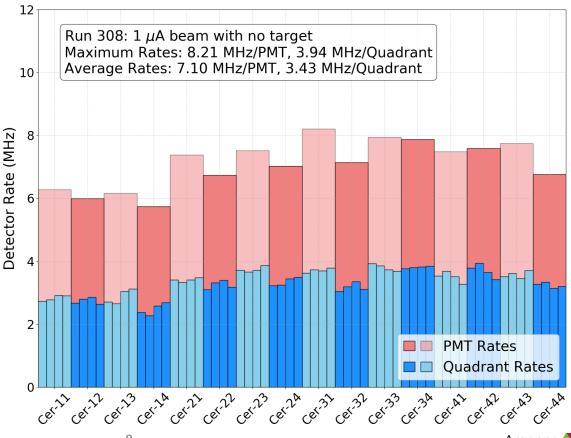

# **Total Rates from Pulser Triggered Runs**

- Reference runs taken before production run
  - Triggered by pulser

Total rates calculation

 $\frac{\overline{N_{peak}} \text{ per window}}{T_{win}(256 \text{ ns})}$ 

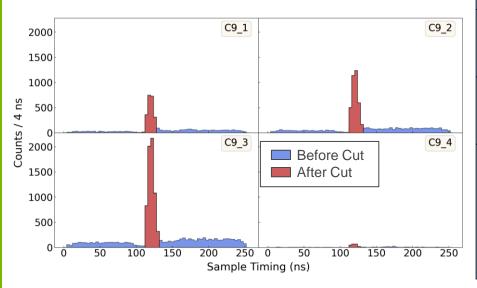

- Peak height threshold
  - 0.25 SPE, max. 8 MHz/PMT
  - 1.0 SPE, max. 7 MHz/PMT

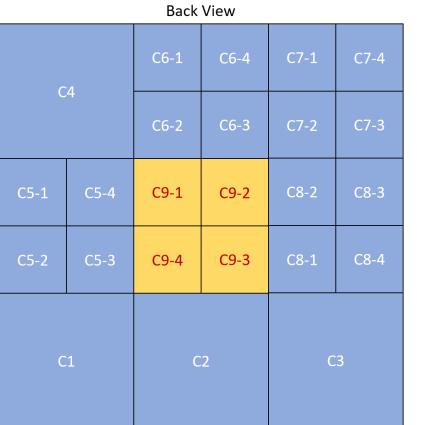

# **Calorimeter Trigger Cut**

- Cut on central sub-blocks to select events with full acceptance
- Cut calorimeter timing with 20 ns window

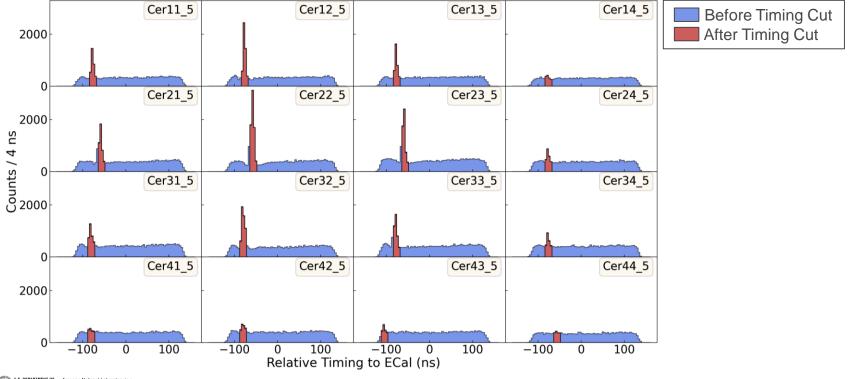

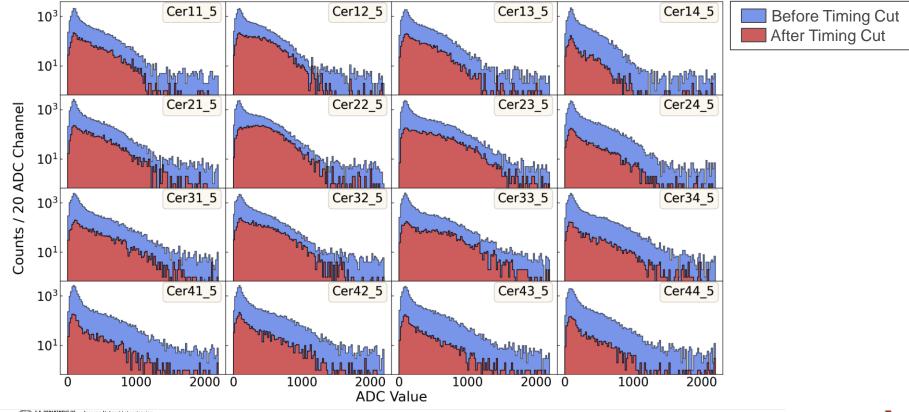

# **Signal Timing Cuts**

• Timing relative to the triggered calorimeter channel,  $\pm 10$  ns

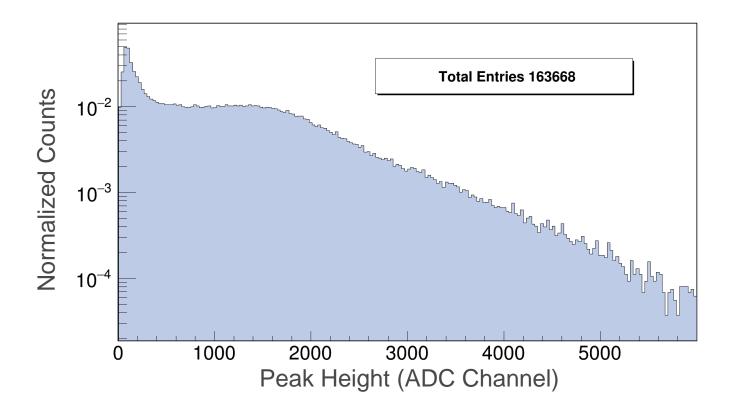

# **Signal Height Distributions**

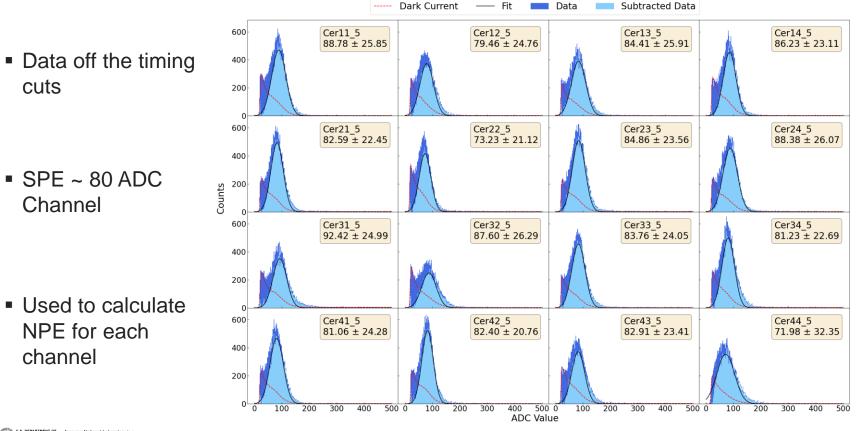

Argonne

# **Signal Sum**

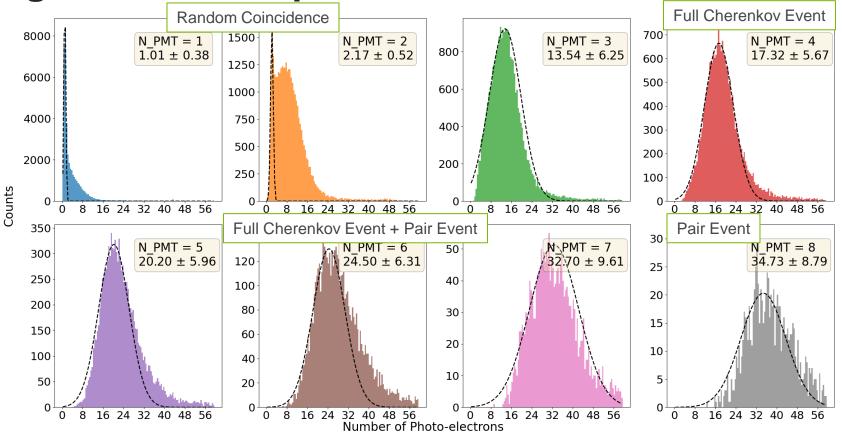

# **Single Photo-Electron Signals**

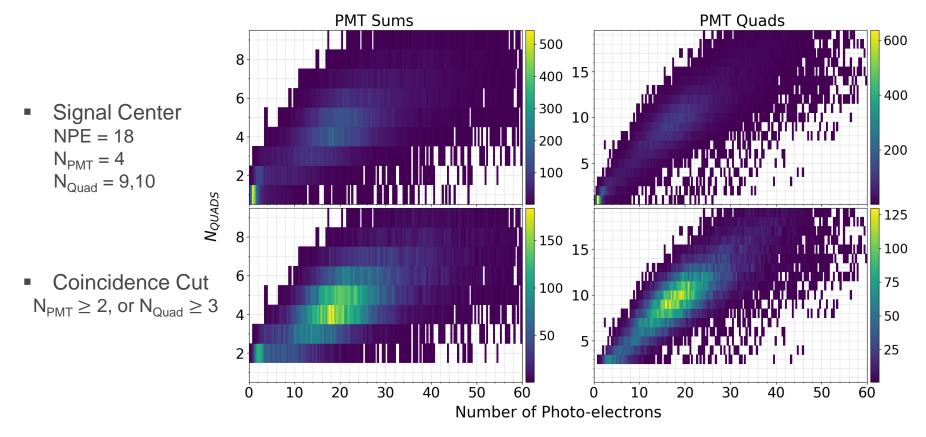

**Signal Sum Groups** 

### **MaPMT Performance**

Argonne National Laboratory is a U.S. Department of Energy laboratory managed by UChicago Argonne, LLC.

BENERGY Argonne National Laboratory is a U.S. Department of Energy laboratory managed by UChicago Argonne, LLC.

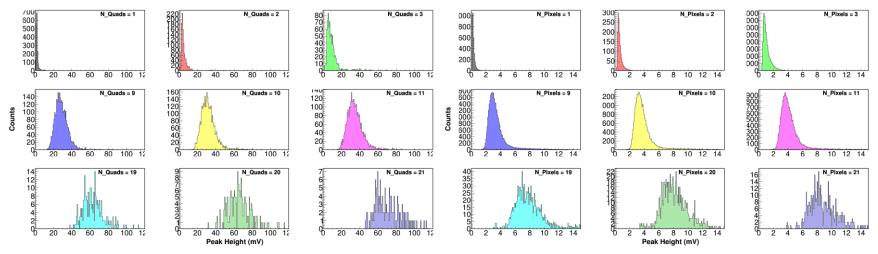

# **MaPMT/LAPPD** Comparison

LAPPD signals are much narrower, but with lower amplitudes

# MaPMT/LAPPD Comparison

- Similar analysis has been performed on LAPPD data (low rate)
- LAPPD results behave similarly to MaPMT (low rate)
- Signal amplitudes are significantly lower in beam-test than that in gain-matching

18

MaPMT

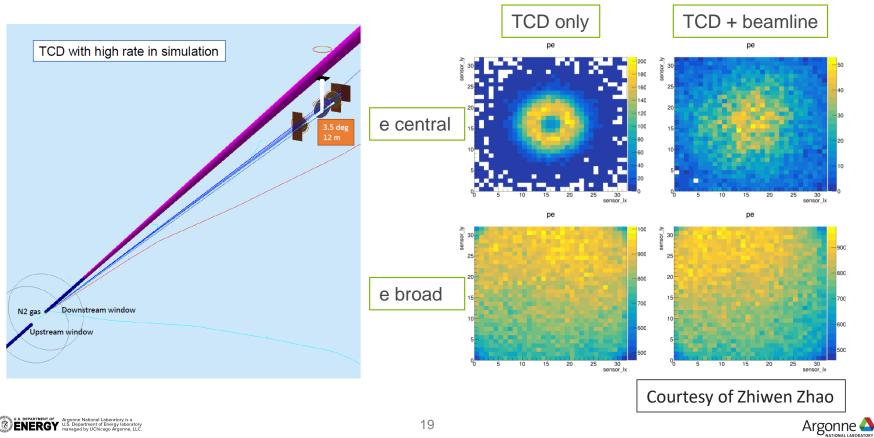

LAPPD

Argonne National Laboratory is a

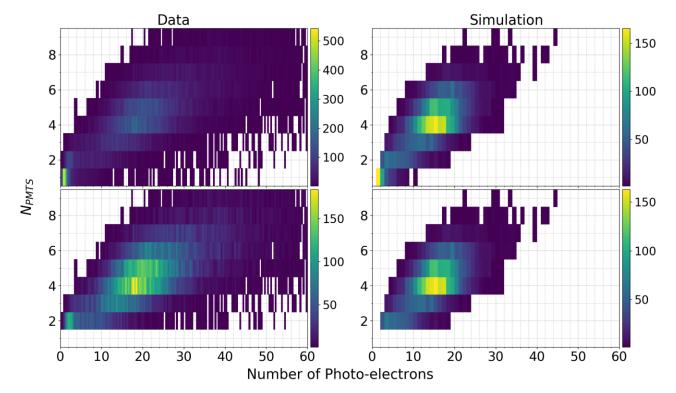

# **Simulation**

# Simulation vs. Data

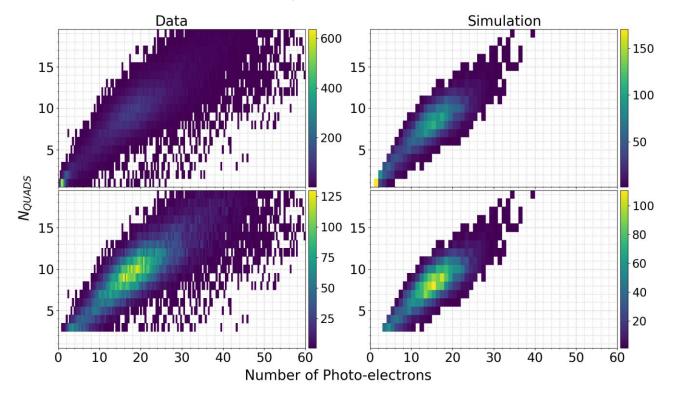

Simulation results of NPE scaled by 0.6

# Simulation vs. Data

Simulation results of NPE scaled by 0.6

# **Summary and Plans**

- MaPMT works well in a high-rate environment of 300 kHz per cm<sup>2</sup>
  - Satisfy the requirement
  - Majority of the random background can be rejected by requiring coincidence between different PMTs/Quadrants
- LAPPD exhibits a similar performance
  - High magnetic field tolerance, narrow signal
  - Significantly lower amplitudes from beam-test data than that from oscilloscope
- Plans
  - Comparison study of MaPMT high-rate test taken with different beam currents
  - Investigate the "0.6" factor needed for simulation to match the data
  - Investigate the LAPPD signal amplitudes with bench test data
